

Enerflex in action

Eagle Ford Shale, Texas, USA

Twelve module multi-dew point plants

Customized solution becomes the blueprint for future development — saving time and money.

Enerflex engineered, designed, and manufactured multiple natural gas processing plants ranging in size from 45 MMSCFD to 80 MMSCFD.

Each plant consists of (12) modules, including a gas processing system, refrigeration system, depropanizer and debutinizer columns, stabilizer, ethylene glycol regeneration package, hot oil system, VRU compression, and engine-driven refrigeration compression.

Enerflex's expertise in modularized gas plants minimized project time and price risk.

Outcome

A collaborative design between Enerflex and the customer maximized the potential of the plant, while minimizing expenditure and time-to-market for the liquids-rich gas. The Texas plants are now a blueprint that can be easily applied to similar shale plays around the country.
