Palembang, Indonesia

Deep cut turbo-expander LPG processing facility

LPG facility and expansion of the
LPG brownfield plant.

Enerflex was awarded the contract for the expansion of an LPG brownfield plant originally completed by Enerflex.. The target for the new plant was to increase LPG recovery to 94%, while increasing production to approximately 191 MTD(measurement tons per day). The facility separates propane, butane, and condensate from liquids-rich gas produced locally, then processes the propane and butane into petrochemical and consumer-grade LPG.

Outcome

The facility successfully increased the proportion of liquids recovered from the gas stream from 60% to 95%. Enerflex provided the engineering, design, manufacturing, construction, and commissioning for this project — providing a single source solution for our customer.
