

# Enerflex in action

## Permian Basin, West Texas, USA

Over 65 compressor packages installed in the area, totaling more than 125,000 HP

Reliable and skilled field technicians provide unmatched service and expertise for long-standing customer's intense multi-unit set – completed under one year.

Enerflex engineered, designed, and manufactured more than 65 three-stage CAT 3606 (A4 / LE) / Dresser Rand 7HOS4 reciprocating compressor packages, within 12 months, for a single customer's multi-site project across the Permian Basin. Numerous units were located on each site – with packages capable of producing 1,785 HP to 1,875 HP and flowing 6.8 MMSCFD. Enerflex also constructed the units on-site, partnering with technicians from Dresser Rand and CAT to ensure the streamlined commissioning of the new equipment.

## Outcome

The units were spread across west Texas requiring the Enerflex team to move quickly from location to location, often commissioning two to three units per week. The team dealt with all the details – from setting the engine on the skid, to taking inventory of the shipment, checking frame and coupling alignments, and hooking up hoses, electrical wires, and coolers. After each unit was up and running, Enerflex's expert technicians returned the next day to remove water suction screens and check hot alignments. This customer is one of Enerflex's long standing respected partnerships and has continued to work with Enerflex for more than 25 years.
